1. Introduction

This Functional Servicing and Stormwater Management Design Report has been prepared to document the proposed site servicing and stormwater management design for the residential development at 302-306 Edinburgh Road South in the City of Guelph.

The Owner is required to have a Professional Engineer design a stormwater management system and have the said Engineer supervise and certify that the stormwater management system was installed in accordance with the approvals issued by the City of Guelph.

Topographic survey was completed by Van Harten Land Surveyors in November 2024. The Site Grading and Servicing Plans have been prepared by GEI Consultants Canada Ltd. dated January 2025.

2. Site Information

The site (302-306 Edinburgh Road South) consists of two (2) existing residential buildings along with the associated driveways. The site is approximately 0.364 ha in size and is located along Edinburgh Road South, approximately 70m east of the intersection of Edinburgh Road South and Young Street.

The site is bound by existing residential development to the north, east and west and Edinburgh Road South to the south.

3. Proposed Development

This proposed development consists of four (4) semi-detached dwellings (8 units total, each with a basement), along with driveway access to Edinburgh Road South.

3.1. Sanitary Servicing

The existing dwellings at 302-306 Edinburgh Road South are serviced by individual sanitary service laterals extended from the existing 300mm diameter sanitary sewer located on Edinburgh Road South.

Sanitary service for the proposed development will be provided via the extension of eight (8) 100mm diameter sanitary service laterals extended from the existing 300mm diameter sanitary sewer on Edinburgh Road South.

The following table summarizes the flows discharging from the site to the municipal sanitary sewer system. Sanitary sewer design sheets are found in Appendix A.

Table No. 1: Anticipated Sanitary Design Flows to Edinburgh Road South

	Anticipated Sanitary Design Flow
Average Domestic Sanitary Sewer Flow (16 units @ 3.4 people per unit, @ 300 L/capita/day)	0.000194 m ³ /s
Peak Sanitary Sewer Flow (PF=4, based on Harmon's Formula)	0.000778 m ³ /s
Extraneous Flow	0.000091 m ³ /s
Total Sanitary Flow	0.000869 m ³ /s
Existing 300mm diameter Sanitary Sewer Capacity	0.049 m³/s

Therefore, the anticipated sanitary sewer flow discharging to the existing 300mm diameter sanitary sewer on Edinburgh Road South is 0.000869m³/s.

3.2. Storm Servicing

Currently, stormwater runoff generated from the site sheetflows overland towards the Edinburgh Road South right-of-way and to the adjacent properties to the north, east and west.

Following development, runoff generated from the rooftops and rear yard landscaped areas will be directed to proposed infiltration galleries located in the rear yard area. Any runoff exceeding the capacity of the proposed infiltration galleries will sheetflow overland to the Edinburgh Road South via a swale located along the west boundary of Parcel 1. Runoff generated from the front yard areas, and driveways will sheetflow overland to the Edinburgh Road South right-of-way.

The site's complete stormwater management design is described in Section 4.

3.3. Watermain Servicing

The existing dwellings at 302-306 Edinburgh Road South are currently serviced via individual water service laterals extended from the existing 200mm diameter watermain located on Edinburgh Road South.

Water service for the proposed development will be provided via the extension of eight (8) 50mm diameter water service laterals extended from the existing 200mm diameter watermain on Edinburgh Road South.

As per the City of Guelph Water and Wastewater Servicing Master Plan (dated June 5, 2023), the residential water servicing demand is 228 liters per capita per day (167 L/c/d residential + 61 L/c/day non-revenue water). Based on an occupancy of 4 people per unit, the total daily water demand per unit is 912 L/day. Therefore, the anticipated water demand is 14,592 L/day for the 16 units (8 units, each with a basement unit).

3.4. Foundation Drainage

Foundation drainage for the proposed development will be provided via sump pumps discharging to grade at the rear of each unit. No storm service laterals are proposed.

4. Stormwater Management

4.1. Design Criteria

From the City of Guelph Development Engineering Manual (dated October 2023), see Appendix G (Figure 4.2 Stormwater Control Criteria), 302-306 Edinburgh Road South is located within Policy Area 13. On this basis, the stormwater management criteria for the site are as follows:

1. Maintain predevelopment recharge rate, volume and hydroperiods under post-development conditions,
2. Provide a minimum of 5mm of volume control,
3. Provide an enhanced level water quality treatment and,
4. Control post-development peak flows to the pre-development level for all design storm events (2-100 year).

The City of Guelph Chicago Storm parameters used to model the 2-year to 100-year design storm events for the site are summarized in the following Table No. 2. These parameters are consistent with the City of Guelph Stormwater Management Master Plan (dated March 2023).

Table No. 2: City of Guelph - Chicago Storm Parameters

Coefficient	2-Year	5-Year	10-Year	25-Year	50-Year	100-Year
a	563.699	750.423	855.183	972.202	1054.539	1122.601
b	1.5	1.5	1.5	1.5	1.5	1.5
c	0.766	0.769	0.764	0.752	0.746	0.738
r	0.4	0.4	0.4	0.4	0.4	0.4
Duration (min)	240	240	240	240	240	240

The Horton infiltration method was used in the MIDUSS model. The following parameters summarized in Table No. 3 were used according to the City of Guelph Standards:

Table No. 3: MIDUSS Horton Parameters

	Impervious Areas	Pervious Areas
Maximum Infiltration (mm/hr)	0.0	75.0
Minimum Infiltration (mm/hr)	0.0	12.5
Lag Constant (hr)	0.00	0.25
Depression Storage (mm)	1.5	5.0

4.2. Existing Conditions

Under existing conditions, the 0.364-hectare site has been modelled as three (3) catchments (see Figure No. 1). The existing condition MIDUSS modelling files are included in Appendix B.

Catchment 101 (0.3270 hectares 38% impervious) represents the existing driveway, existing covered porch, existing walkway, existing landscaped area in the front yard, existing garage and shed in the rear yard and the existing building at 302 and 306 Edinburgh Road South. Runoff generated from this catchment currently sheetflows overland towards the Edinburgh Road South right-of-way.

Catchment 102 (0.0130 hectares 0% impervious) represents the existing landscaped area in the rear yard at 302 Edinburgh Road South. Runoff generated from this catchment currently sheetflows overland to the adjacent property to the west.

Catchment 103 (0.0240 hectares 0% impervious) represents the existing landscaped area and existing shed in the rear yard at 306 Edinburgh Road South. Runoff generated from this catchment currently sheetflows overland to the adjacent properties to the north and east.

4.2.1. Existing Condition Flow Rates

The hydrologic model MIDUSS was used to create the design storm runoff hydrographs and to route the hydrographs. A summary of the existing conditions peak flow rates from the site during the 2 to 100-year design storm events are provided in Table No. 4 below. The existing conditions MIDUSS output file is attached in Appendix B.

Table No. 4: Existing Condition Flow Rates

	Peak Flow Rate (m ³ /sec)					
	2-Year	5-Year	10-Year	25-Year	50-Year	100-Year
Catchment 101	0.034	0.048	0.057	0.070	0.080	0.090
Catchment 102	0.000	0.001	0.001	0.002	0.002	0.003
Catchment 103	0.001	0.002	0.002	0.003	0.004	0.005
Total Flow from Site	0.034	0.049	0.059	0.074	0.085	0.096

4.3. Allowable Release Rates

The City of Guelph criteria for Policy Area 13 requires that all post-development peak flows generated from the site be controlled to the pre-development level for all design storm events (2-100 year). Therefore, the allowable release rates from the site are as follows:

Table No. 5: Allowable Flow Rates

	Peak Flow Rate (m ³ /sec)					
	2-Year	5-Year	10-Year	25-Year	50-Year	100-Year
Total Flow from Site	0.034	0.049	0.059	0.074	0.085	0.096

FIGURE # 1	FIGURE # 1

4.4. Post-Development Conditions

For post-development analysis purposes, 302-306 Edinburgh Road South (0.364 hectares) was modelled as three (3) drainage catchments. The post-development drainage catchments are shown on Figure No. 2. The post-development MIDUSS computer modeling and stage-storage-discharge tables are attached in Appendix B.

Catchment 201 (0.1150-hectares, 50% impervious) represents the front yards and driveways in the front of the proposed semi-detached dwellings. Runoff generated from Catchment 201 will sheetflow overland to the Edinburgh Road South right-of-way uncontrolled.

Catchment 202 (0.2488-hectares, 45% impervious) represents the rooftop and rear yard area of Parcel 1 to 8. Runoff from Catchment 202 will sheetflow overland to the proposed infiltration galleries in the rear yard of Parcel 1 to 8. Runoff from Catchment 202 which exceeds the capacity of the infiltration galleries will sheetflow overland to the Edinburgh Road South right-of-way via swale located west of Parcel 1.

The infiltration galleries located in the rear yards of Parcel 1 to 8, provides a storage volume of 25.60 m³. A blanket easement will be provided for drainage across Parcel 1 to 8. The alignment of infiltration galleries has shown on the engineering drawings.

All roof downspouts from Catchments 202 are to be directed to the rear yard areas. No roof downspouts are to be directed to the side yards. In addition to this, all runoff directed to the side yard area has been minimized to match existing drainage patterns.

Catchment 203 (0.0002-hectares, 0% impervious) represents the landscaped area in the rear yard of Parcel 1. Runoff generated from this catchment will sheetflow overland to the adjacent property to the west.

The parameters utilized in the Post-Development Condition Analysis are summarized in Table No. 6.

Table No. 6: Proposed Drainage Areas:

Catchment	Area (Hectares)	Impervious Area (Hectares)	Imperviousness (%)
Catchment 201	0.1150	0.0575	50
Catchment 202	0.2488	0.1120	45
Catchment 203	0.0002	0.0000	0

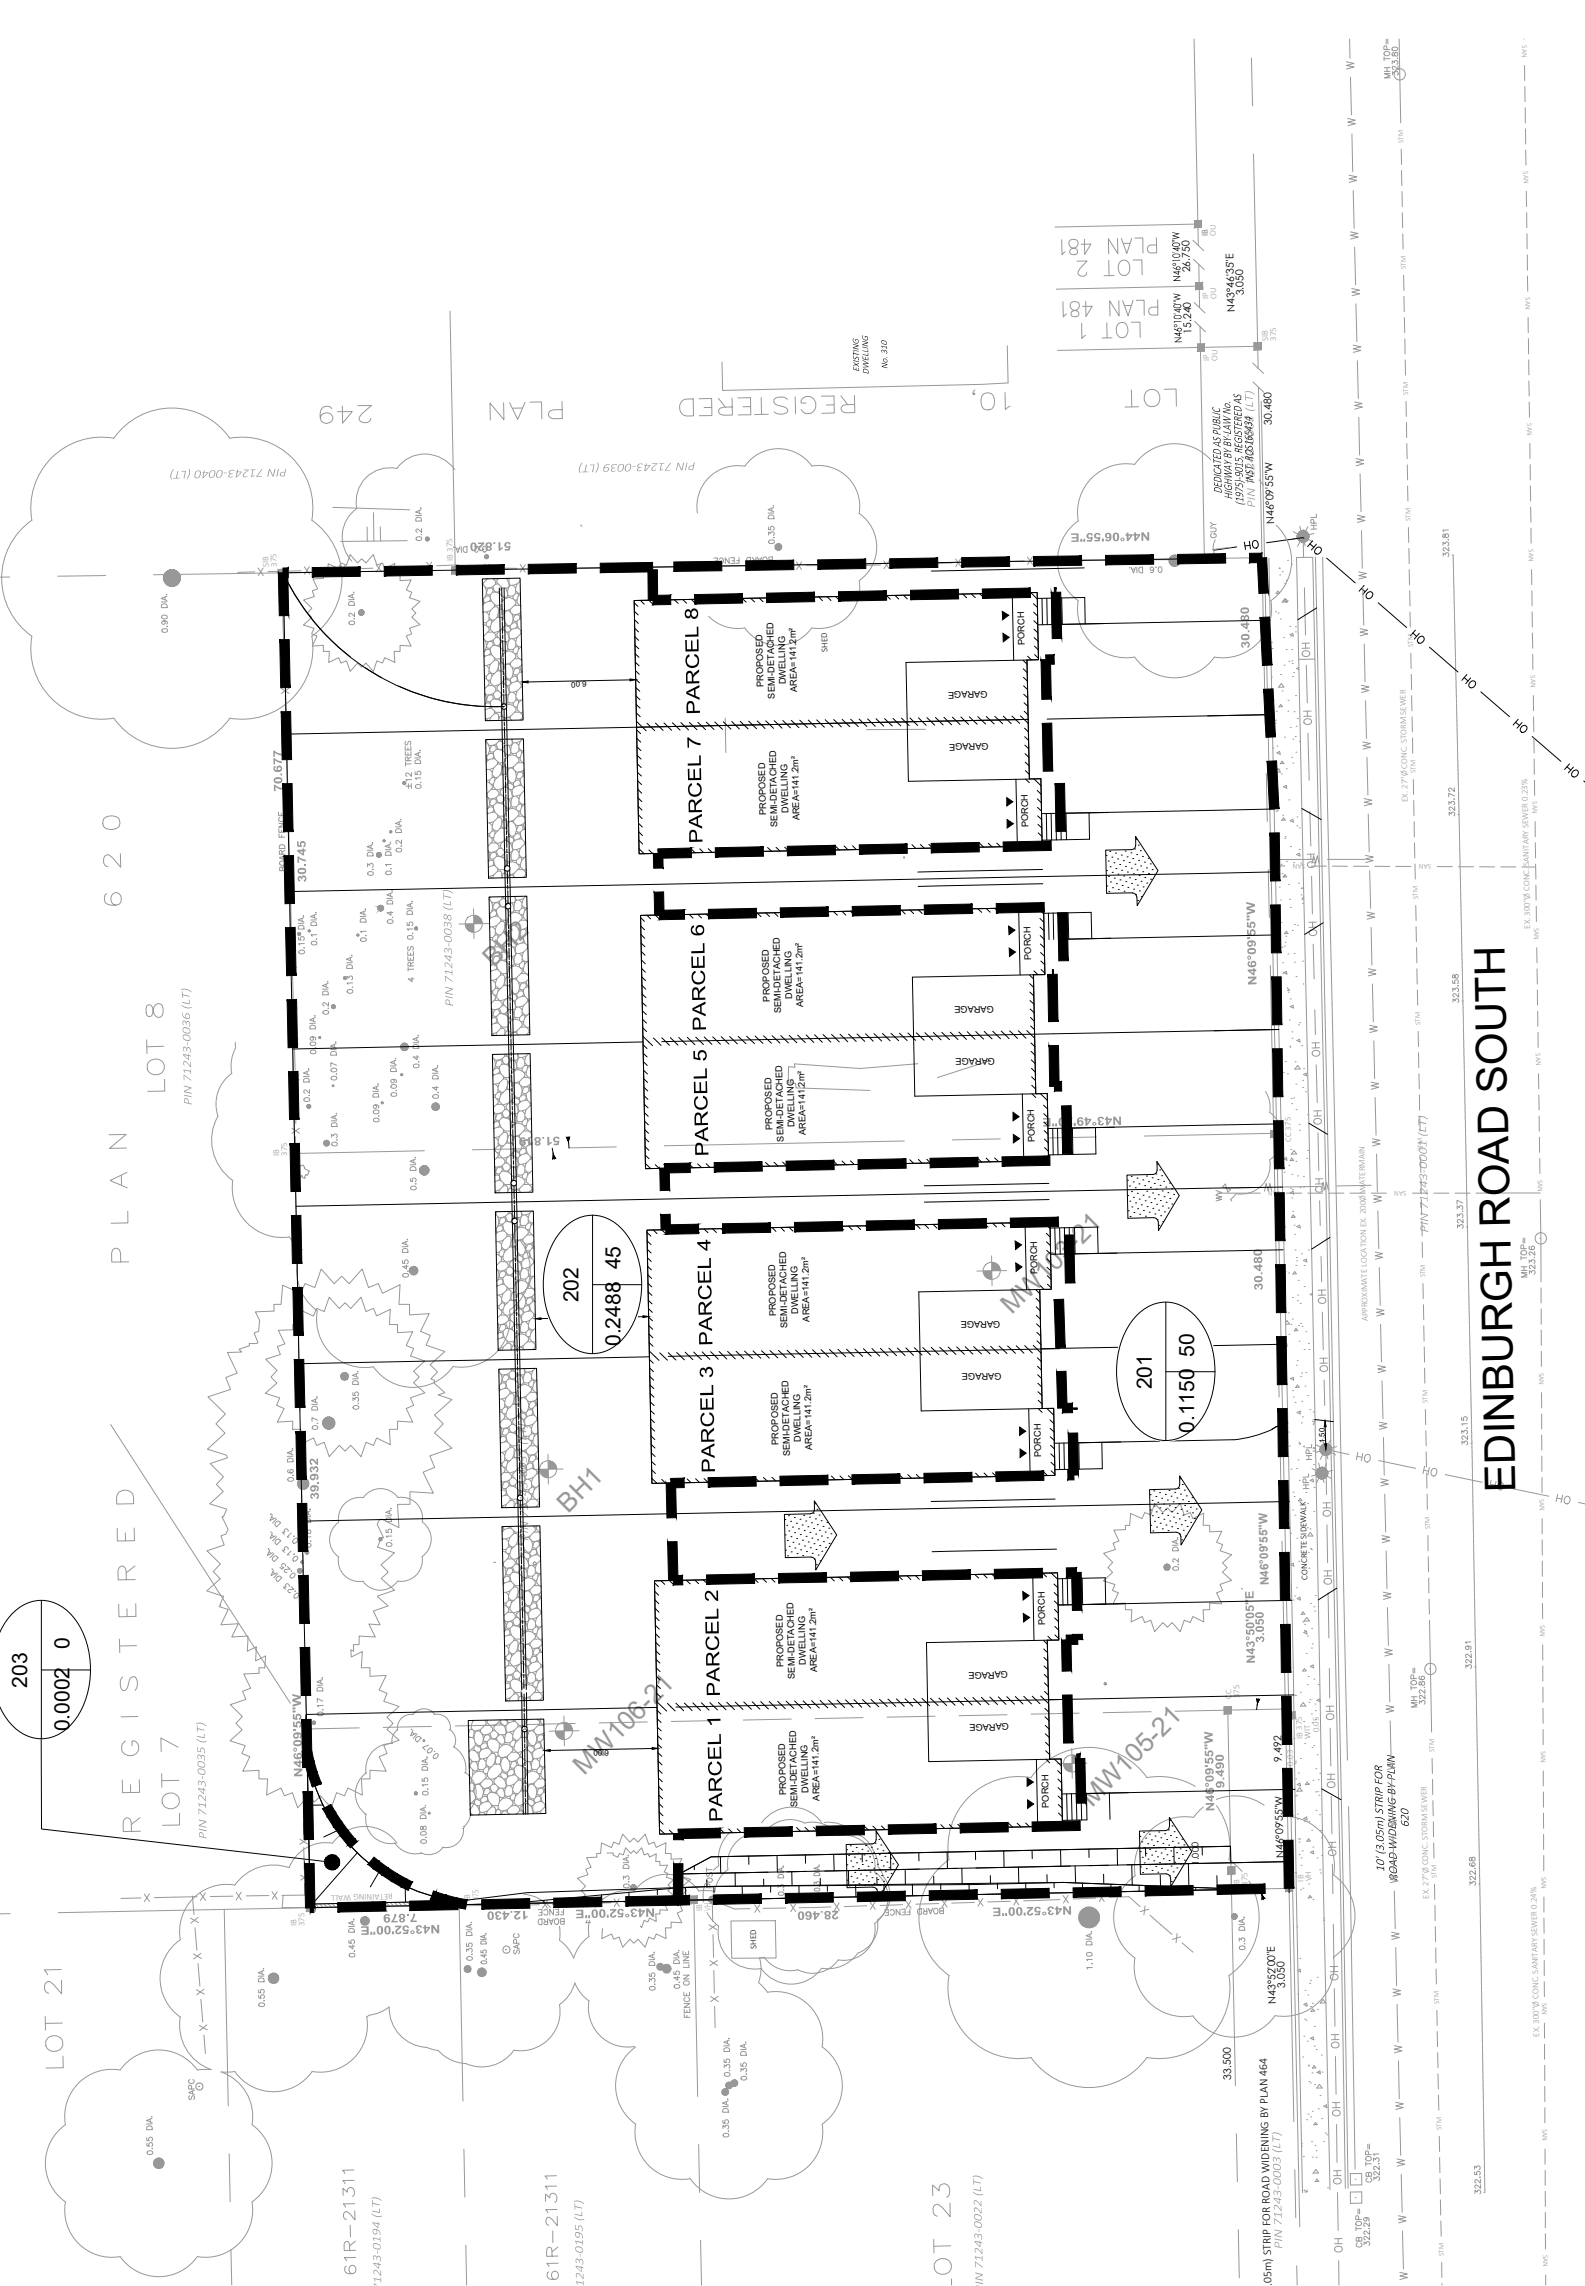

4.5. Routing – Post-Development Conditions

The hydrologic model MIDUSS was used to create the design storm runoff hydrographs and to route the hydrographs.

The routing results for the proposed underground infiltration galleries are summarized in Table No. 7 below.

50 Year	---	---	---	0.049	28.766	323.504
100 Year	---	---	---	0.056	29.033	323.521
Overflow	0.085	29.172	323.530	---	---	---

A summary of the post-development condition flow rates for the 2-year to 100-year design storm events are provided in Table No. 8 below:

Table No. 8: Post-Development Condition Flow Rates For 2 to 100 Year Design Storm Events

	Flow Rate (m ³ /sec)					
	2-Year	5-Year	10-Year	25-Year	50-Year	100-Year
Catchment 201	0.015	0.022	0.026	0.031	0.035	0.039
Catchment 202	0.002	0.015	0.028	0.040	0.049	0.056
Catchment 203	0.000	0.000	0.000	0.000	0.000	0.000
Total	0.017	0.023	0.043	0.059	0.071	0.081

A comparison of the existing condition flow rates, allowable release rates and post-development flow rates from the site for the 2-year to 100-year design storm events are provided in Table No. 9 below.

Table No. 9: Comparison of Existing Peak Flows and Post-Development Flow Rate from The Site

	Flow Rate (m ³ /sec)					
	2-Year	5-Year	10-Year	25-Year	50-Year	100-Year
Existing Condition Total Flow off site	0.034	0.049	0.059	0.074	0.085	0.096
Allowable Release Rate	0.034	0.049	0.059	0.074	0.085	0.096
Post-Development Condition Total Flow off-site	0.017	0.023	0.043	0.059	0.071	0.081

As shown in Table No. 9 above, all post-development flow rates from the site (for the 2 to 100-year design storm events) have been attenuated to be less than the existing condition flow rates, and the allowable release rates.

4.6. Volume Retention

As per the City of Guelph criteria a minimum of 5mm volume control is to be provided. Based on the area of the proposed development (0.364 ha), 18.20 m³ of runoff is to be retained on site to comply with the 5mm of volume control.

On-site retention for this development will be provided via infiltration galleries located in the rear yard of Parcel 1 to Parcel 8. The proposed infiltration galleries in the rear yards of Parcel 1 to Parcel 8 provide a storage volume of 25.60m³.

Therefore, eight (8) infiltration galleries have been designed to capture and retain 25.60m³ of runoff from the site.

The following table summarizes the retention storage volume provided in each infiltration gallery.

Table No. 10: Post-Development Required and Proposed Retention Storage Volume

Lot Number	Required Retention Volume (m³)	Provided Retention Volume (m³)
Parcel 1 – Infiltration Gallery 1	2.35	3.2
Parcel 2 – Infiltration Gallery 2	2.35	3.2
Parcel 3 – Infiltration Gallery 3	2.25	3.2
Parcel 4 – Infiltration Gallery 4	2.25	3.2
Parcel 5 – Infiltration Gallery 5	2.25	3.2
Parcel 6 – Infiltration Gallery 6	2.25	3.2
Parcel 7 – Infiltration Gallery 7	2.25	3.2
Parcel 8 – Infiltration Gallery 8	2.25	3.2
Total Retention	18.20	25.60

Therefore, based on Table 10, the first 5mm of rainfall on-site has been retained on site.

4.7. Quality Control Treatment

Quality control treatment for runoff generated from the site will be provided by directing runoff over grassed surfaces prior to discharge from the site.

5. Water Balance

In order to determine the hydraulic conductivity of the on-site soil, a Guelph Permeameter test was completed for 302-306 Edinburgh Road South by CMT Engineering Ltd. on November 5, 2024. Four separate tests were completed at two (2) Test Locations, associated with 302-306 Edinburgh Road South, and were run at depths of 2.4m and 3.9m below the existing grade. The results of the Guelph Permeameter completed by CMT Engineering Ltd., and the calculated design infiltration rate for 302-306 Edinburgh Road South are shown below. CMT Engineering Ltd.'s complete Guelph Permeameter Test report is attached as Appendix C.

The design infiltration rate was determined through the process specified in Appendix C of the CVC / TRCA Low Impact Development Stormwater Management Planning and Design Guide V1.0 (dated 2011). The Safety Correction Factor is per Table C2 and the conversion of hydraulic conductivity (cm/s) to infiltration rate (mm/hr) is as per Figure C1.

Table No. 11: Permeameter Test Results and Design Infiltration Rate

Test Location	Approximate Bottom of Gallery		Below Gallery		Ratio of Infiltration Rate at Gallery Bottom to Below Gallery	Safety Factor	Design Infiltration Rate (mm/hr)
	Hydraulic Conductivity (cm/s)	Infiltration Rate (mm/hr)	Hydraulic Conductivity (cm/s)	Infiltration Rate (mm/hr)			
I	8.39E-4	70.5	3.94E-4	58.2	1.21	2.5	28.2
II	9.32E-4	73.1	7.23E-4	67.3	1.09	2.5	29.2

Under existing conditions, the annual recharge volume for the site is 774 m³/year. As provided in the Monthly Water Balance calculations (Thornthwaite and Mather), under post development conditions, the 0.364-ha site provides a total recharge volume of 2048 m³ via the infiltration galleries. The infiltration galleries were located to ensure the required 1.0 m separation from the high groundwater level was maintained. Monthly water balance summary for all catchments is shown in the Table 12 below.

Therefore, the proposed development provides a total of 2048 m³ of recharge annually, which is more than 774 m³ provided under existing conditions. The required annual post-development recharge volume for the site meets the required volume recharge for Policy Area 13 from the City's Development Engineering Manual (dated October 2023).

The complete Monthly Water Balance calculation is provided in the Appendix D.

Table No. 12: Monthly Water Balance Summary

Month	Existing Recharge Volume (m ³)				Proposed Recharge Volume (m ³)			
	Catchment			Total	Catchment			Total
	101	102	103		201	202	203	
Jan	16	1	2	18	5	41	0	46
Feb	8	0	1	9	2	21	0	23
Mar	4	0	1	5	1	11	0	12
Apr	72	4	8	84	21	187	0	208

Jul	73	3	5	80	23	201	0	225
Aug	53	1	3	57	18	151	0	169
Sep	38	1	1	40	13	111	0	125
Oct	26	0	1	27	9	77	0	86
Nov	65	3	6	75	19	173	0	192
Dec	32	2	3	37	10	86	0	96
Total	681	33	60	774	209	1,838	1	2,048

6. Erosion Protection and Sediment Control

A silt fence is to be installed along the perimeter of the property. The silt fence serves to minimize the opportunity for sediment to leave the site.

Upon completion of the grading, any area not subject to active construction within 30 days will be topsoiled and hydroseeded as per OPSS PROV 804. Inspection and maintenance of all silt fencing will start after installation is complete. The silt fence will be inspected on a weekly basis during active construction or after a rainfall event of 13 mm or greater. Maintenance will be carried out, within 48 hours, on any part of the silt fence found to need repair.

Once construction and landscaping has been substantially completed, the silt fence will be removed, any accumulated sediment will be removed, and the landscaping will be completed. After construction of the complete development, erosion and sediment transport will be minimal.

7. Conclusions

In summary, the features of the design for the proposed development are as follows:

1. Sanitary service for each Parcel will be provided by individual 100mm diameter sanitary service lateral extended from the existing 300mm diameter sanitary sewer on Edinburgh Road South.
2. Water service for each Parcel will be provided by individual 50mm diameter water service lateral extended from the existing 200mm diameter watermain on Edinburgh Road South.
3. Foundation drainage will be provided via a sump pump discharging to grade at the rear of each unit. No storm service laterals are proposed.
4. The first 5mm of rainfall on-site has been retained in the proposed depression storage and bioretention swale on-site.
5. All post-development flow rates from the site (for the 2 to 100-year design storm events) have been attenuated to be less than the existing condition flow rates.
6. All roof downspouts from Catchments 202 are to be directed to the rear yard areas. No roof downspouts are to be directed to the side yards.
7. All runoff directed to the side yards match existing drainage patterns.
8. The 302-306 Edinburgh Road South annual water balance recharge volume is 2048 m³ per year, approximately 1274 m³ more than the existing condition recharge volume of 774 m³ per year.

All of which is respectfully submitted.

Dear Zachary:

**Re: Monitoring Well Installation and Infiltration Testing
302 and 306 Edinburgh Road South
Guelph, Ontario**

As requested, CMT Engineering Inc. conducted a geotechnical investigation which included monitoring well installation and in-situ infiltration testing at the above-referenced site, and we are pleased to present the enclosed report.

We trust that this information meets your present requirements, and we thank you for allowing us to undertake this project. Should you have any questions, please do not hesitate to contact our office.

Yours truly,

[Redacted Signature]

Jake Feeney, P.Eng.

1.0 INTRODUCTION

The services of CMT Engineering Inc. (CMT Inc.) were retained by Mr. Zachary Fisher of Mezcon Construction Ltd. to conduct a geotechnical investigation including monitoring well installation and in-situ infiltration testing for the proposed infiltration galleries to be constructed to service the site redevelopment at 302 and 306 Edinburgh Road South, in Guelph, Ontario.

A geotechnical investigation was previously completed by MTE for the subject site with the findings and recommendations provided in the report titled “*Geotechnical Investigation Report, Proposed Residential Development, 302 & 306 Edinburgh Road South, Guelph, Ontario*”, MTE File Number 49495-100-rev100, and dated November 3, 2021. This report should be read in conjunction with the previously issued geotechnical report for the site.

It is understood that the proposed residential development requires insitu permeability testing in accordance with the Low Impact Development Stormwater Management Planning and Design Guide (LIDSMPDG) at the proposed infiltration gallery locations. Two (2) infiltration galleries are proposed for the site. Currently, the location and size of the proposed infiltration gallery(s) has not been determined. As such, in-situ permeability testing was conducted at depths of 2.4 m (7.9 ft) and 3.9 m (12.8 ft) below the ground surface. The location of the site is shown on Drawing 1.

The purpose of the geotechnical investigation was to assess the existing soil and groundwater conditions encountered in the boreholes advanced in the general locations of the proposed stormwater infiltration galleries. Included in the assessment are the soil classification and groundwater observations; soil parameters for design of infiltration galleries; and a summary of the laboratory test results.

The recommendations in this report are solely based on the soil conditions encountered in the boreholes located at the subject site.

2.0 EXISTING SITE CONDITIONS

The subject site contains two existing residential buildings with associated driveways. The site is bounded by residential properties in all directions and Edinburgh Road South to the southwest. The general site topography is relatively flat in elevation.

3.0 FIELD AND LABORATORY PROCEDURES

Prior to the commencement of the field drilling program, underground service locates were organized by CMT Inc. to ensure that underground utilities would not be damaged.

The field investigation was conducted on October 7, 2024, and comprised the advancement of two (2) boreholes (referenced as Boreholes 1 and 2), utilizing a Geoprobe 7822DT drillrig operated by CMT Drilling Inc. The boreholes were advanced to approximate depths ranging from 3.90 m (12.8 ft) to 4.57 m (15.0 ft) below the existing grade in the locations of the proposed infiltration galleries.

Boreholes 1 and 2 were advanced utilizing Macro core (MC5) direct push soil sampling, in accordance with ASTM D6282/D6282M-14 "Standard Guide for Direct Push Soil Sampling". Technical staff from CMT Inc. observed the drilling operation and collected and logged the recovered soil samples. A small portion of each sample was placed in a sealed, marked jar for moisture content determinations.

Representative samples from the following depths were submitted to the CMT Inc. laboratory in St. Clements, Ontario for grain size analyses:

- Borehole 1 – approximate depth 1.52 m to 3.05 m (5.00 ft to 10.00 ft),
- Borehole 1 – approximate depth 3.51 m to 4.57 (11.50 ft to 15.00 ft),
- Borehole 2 – approximate depth 1.52 m to 3.05 m (5.00 ft to 10.00 ft),
- Borehole 2 – approximate depth 3.35 m to 4.57 m (11.00 ft to 15.00 ft).

The borehole logs are provided in Appendix A and the grain size analyses are provided in Appendix B.

One (1) monitoring well was installed in Borehole 2 by CMT Inc and three (3) monitoring wells were installed during the MTE geotechnical investigation (referenced as MW103-21, MW105-21 and MW 106-21). The monitoring well at Borehole 2 comprised a 25 mm (1.0 inch) diameter PVC pipe with a 1.52 m (5.0 ft) long slotted screen. The monitoring well screen was backfilled with filter sand, and riser pipes backfilled with bentonite. The monitoring wells were installed in accordance with the Ontario Water Resources Act, Regulation 903 (O. Reg. 903) by well technicians licensed by the Ministry of the Environment, Conservation and Parks (MECP). The well records are provided in Appendix D.

The ground surface elevation at the borehole locations were surveyed by CMT Inc. following drilling on October 7, 2024. Borehole 1 was determined to have a ground surface elevation of about 324.16 m above sea level, while Borehole 2 was determined to have a ground surface elevation of about 324.23 m above sea level. The location of the boreholes are shown on Drawing 2.

4.0 SUBSOIL CONDITIONS

The soils encountered in the boreholes are described briefly below and a more detailed stratigraphic description is provided on the borehole logs in Appendix A. The following paragraphs have been simplified into terms of major soil strata. The soil boundaries indicated have been inferred from observations of sampling and drilling resistance and typically represent transitions from one soil type to another rather than exact planes of geological change. Further, the subsurface conditions are anticipated to vary beyond the borehole locations.

4.1. Topsoil

Dark brown, silty, organic topsoil was encountered at the surface of Boreholes 1 and 2. The topsoil ranged in thickness from approximately 150 mm to 300 mm, however the topsoil thickness should be expected to vary throughout the site. Materials noted as topsoil in this report were classified based on visual and textural evidence. Testing of organic content or for other nutrients was not carried out.

4.2. Silty Sand Fill

Brown silty sand fill with trace gravel was encountered underlying the topsoil at Borehole 2. The silty sand fill was considered to be moist, with a moisture content of about 9.9%. The silty sand fill was approximately 1,370 mm in thickness at the borehole location.

4.3. Gravel and Sand/Gravelly Sand

Brown gravel and sand to gravelly sand with trace silt and clay, was observed underlying the topsoil at Borehole 1 and underlying the silty sand fill at Borehole 2. The gravel and sand/gravelly sand was considered to be moist, with moisture contents ranging from about 1.5% to 3.7% (average 2.4%).

4.4. Clayey Silt

Brown clayey silt with some sand to sandy and trace gravel was encountered underlying the gravel and sand/gravelly sand at Boreholes 1 and 2. The clayey silt was considered to be moist, with moisture contents ranging from about 11.7% to 12.9% (average 12.3%).

4.5. Groundwater

In total, four (4) monitoring wells were installed on the subject site during the geotechnical investigations to measure the static groundwater levels. The water levels were measured by MTE and CMT Inc. personnel following installation on October 28, 2021, September 17, 2024, and subsequently on October 28, 2024.

The measured elevation of water in the monitoring wells, the estimated zone of wet to saturated soils, as well as the ground surface and bottom of borehole elevation, are provided in the following table:

Borehole No.	Ground Surface Elevation (m)	Measured Elevation of Water in Monitoring Well on October 28, 2021 (m)	Measured Elevation of Water in Monitoring Well on September 17, 2024 (m)	Measured Elevation of Water in Monitoring Well on October 28, 2024 (m)	Approximate Zone of Wet to Saturated Soils (m)	Approx. Bottom of Monitoring Well Elevation (m)
BH2	324.23	N/A	N/A	320.13 (4.10)	-	319.66
MW103-21	324.00	318.70	319.74	319.63 (4.37)	-	317.40
MW105-21	323.10	317.20	318.43	318.33 (4.77)	-	316.90
MW106-21	323.40	316.40	317.59	317.64 (5.76)	-	316.00

Groundwater conditions are generally dependent on the amount of precipitation, control of surface water, as well as the time of year, and can fluctuate significantly in elevation and volume.

5.0 DISCUSSION AND RECOMMENDATIONS

This section of the report provides an interpretation of the factual geotechnical data obtained during the investigation and is intended for the guidance of the owner and design engineer. Where comments are made on construction, they are provided only to highlight those aspects which could affect the design of the project. Contractors bidding on or undertaking the work should make their own independent interpretation of the factual subsurface information provided as it affects their proposed construction means and methods, equipment selection, scheduling, pricing, and the like.

Utilizing the information gathered during the geotechnical investigation and assuming that the borehole information is representative of the subsoil conditions throughout the site, the following comments and recommendations are provided.

5.1. Soil Design Parameters

The following table provides the estimated soil design parameters for imported granular fill, as well as the existing native soils encountered on-site. It should be noted that earth pressure coefficients (K_a , K_p , K_o) provided are for flat ground surface conditions and will differ for areas with slopes or embankments.

The estimated soil design parameters can be utilized for the design of perimeter shoring, foundations and retaining walls, lateral earth pressure calculations, as required:

Soil Type	Soil Density (kg/m ³)	Friction Angle (Degree)	Coefficient of Active Pressure (K_a)	Coefficient of Passive Pressure (K_p)	Coefficient of At-Rest Pressure (K_o)	Coefficient of Friction (μ)	Cohesion (kPa)
Imported Granular 'A' (OPSS 1010)	2,100	34°	0.28	3.54	0.44	0.45	0
Imported Granular 'B' (OPSS 1010)	2,050	32°	0.31	3.25	0.47	0.41	0
Silty Sand Fill	1,800	28°	0.36	2.77	0.53	0.35	0
Gravel and Sand	1,900	34°	0.28	3.54	0.44	0.45	0
Clayey Silt	1,800 to 1,900	28° to 32°	0.36 to 0.31	2.77 to 3.25	0.53 to 0.47	0.35 to 0.42	0 to 10

5.2. Infiltration Testing

Appendix C of the LIDSWMP recommends that at least one infiltration test should be conducted at the bottom elevation of the infiltration pit, plus one additional test at every soil horizon encountered within 1.5 m below the bottom elevation (a minimum of two tests per infiltration pit). Appendix C of the LIDSWMP also recommends that one test hole should be advanced for an infiltration pit with a footprint of less than 50 m².

The infiltration testing program was conducted on October 7, 2024, and was comprised of two (2) Guelph Permeameter Constant Head infiltration tests in Boreholes 1 and 2, in accordance with ASTM D5126 Section 4.1.6. The infiltration testing was conducted in

Borehole 1 at depths of about 2.4 m (7.9 ft) and 3.9 m (12.8 ft), and in Borehole 2 at depths of about 2.4 m (7.9 ft) and 3.9 m (12.8 ft). The test hole diameters were approximately 5.72 cm (2.25 in). Constant head permeability testing was conducted using a constant head setting of 10 cm.

The field hydraulic conductivity was converted to infiltration rates using Figure C1 of the LIDSWMP. Based on information gathered from the permeameter testing and borehole data, the following table provides the field saturated hydraulic conductivity, infiltration rate, test location and soil type for each test:

Test Location and Depth (m)	Approx. Elevation of Test (m)	Guelph Permeameter Field Hydraulic Conductivity (K_f) (cm/sec)	No Safety Factor Applied - Infiltration Rate (mm/hour)	Soil Type
BH 1 (2.4)	321.76	8.39×10^{-4}	70.5	Gravelly Sand
BH 1 (3.9)	320.26	3.94×10^{-4}	58.2	Clayey Sandy Silt
BH 2 (2.4)	321.83	9.32×10^{-4}	73.1	Gravel and Sand
BH 2 (3.9)	320.33	7.23×10^{-4}	67.3	Clayey Silt

In order to determine the design infiltration rate, the ratio of the infiltration rate at the proposed bottom of the infiltration pit and the infiltration rate of the least permeable soil horizon within 1.5 m below the proposed bottom elevation of the infiltration gallery is calculated. As per LIDSWMP, the applicable safety factor from Table C2 is applied to the infiltration rate at the proposed base of the infiltration pit. As per Table 3.4.1 of the LIDSWMP, the minimum distance between the base of the infiltration trench and the elevation of the high-water table or bedrock is 1.0 m.

The following table provides the ratio of infiltration rates, safety correction factor and design infiltration rate for the proposed infiltration pit locations:

Proposed Infiltration Pit Location	Proposed Bottom of Infiltration Pit Elevation (m)	Ratio of Infiltration Rates	Safety Correction Factor	Design Infiltration Rate (mm/hour)
BH1	321.76	1.21	2.5	28.2
BH2	321.83	1.09	2.5	29.2

It is required that an inspection of the infiltration gallery base be conducted prior to backfilling to ensure that the soils encountered are consistent with the borehole data so suitable infiltration rates are achieved.

All infiltration structures must be designed as per the City of Guelph Development Engineering Manual, October 2023 (DEM), and the Low Impact Development Stormwater Management Planning and Design Guide (LIDSWMP), as required.

Based on the soil and groundwater data obtained during the geotechnical investigations and monitoring well installations, the highest groundwater elevation measured was at elevation of approximately 320.13 m or approximately 4.1 m (13.5 ft) below the ground surface and anticipated to be below (the target infiltration depths. As per the D.E.M., CMT Inc. will continue to monitor the ground water elevation in the monitoring wells installed at the site on a regular basis in order to collect additional groundwater data through the site development process.

In addition to the above requirements of the DEM, CMT Engineering Inc. recommends the following:

- That each downspout entering the infiltration gallery have a strainer/leaf deflector as well as a rainwater leader overflow outlet just above grade that is equipped with a splash pad to direct water away from the foundation.
- That regular inspection/maintenance of the downspout strainer/leaf deflector is performed to ensure continuous operation and reduce the potential for the accumulation of sediment that can impede the functionality of the infiltration gallery.

The field data sheets for the in-situ infiltration testing can be found in Appendix C of this report.

6.0 LIMITATIONS OF THE INVESTIGATION

The recommendations made in this report are in accordance with our present understanding of the project. We request that we be permitted to review our recommendations when the drawings and specifications are complete, or if the proposed construction should differ from that mentioned in this report.

It is important to emphasize that a soil investigation is, in fact, a random sampling of a site and the comments are based on the results obtained at the test locations only. It is therefore assumed that these results are representative of the subsoil conditions across the site. Should any conditions at the site be encountered which differ from those found at the test locations, we request that we be notified immediately in order to permit a reassessment of our recommendations.

It should be noted that this report specifically addresses geotechnical aspects of the project and does not include any investigations or assessments relating to potential subsurface

contamination. As such, there should be no assumptions or conclusions derived from this report with respect to potential soil or water contamination. Soil or water contamination is generally caused by the presence of xenobiotic (human-made) chemicals or other alteration processes in the natural soil and groundwater environment. If necessary, the investigation, assessment and rehabilitation of soil and water contaminants should be undertaken by qualified environmental specialists.

The samples obtained during the geotechnical investigation will be stored for a period of three months, after which time they will be disposed of unless alternative arrangements are made.

This report is intended solely for the client named. Any use which a third party makes of this report, or any reliance on or decisions to be made based on it, are the reliability of such third parties. The factual data, interpretation, and recommendations in this report pertain to a specific project as described in this report and are not applicable to any other project or site location. If the project is modified in concept, location or elevation, deviates from the assumptions stated herein, CMT Inc. should be given an opportunity to confirm that the recommendations are still valid. The subject geotechnical exploration and this report address only the geotechnical aspects of the proposed project; potential environmental impacts or related issues are beyond the defined scope of this work and have not been addressed.

We trust that this report meets with your present requirements. Should you have any questions, please do not hesitate to contact our office.

APPENDIX D

WELL RECORDS

General Instructions and Explanations for completing a Well Record

A completed electronic Well Record Form must be delivered to the well purchaser and the owner of the land on which the well is situated within 14 days after the date on which the well's structural stage is complete. The electronic Well Record must also be forwarded within 30 days after the date on which the well's structural stage is complete to the ministry through email to the following email address: WellRecordSubmission@ontario.ca

False and Misleading Information

Subsection 98(2) of the *Ontario Water Resources Act*, R.S.O. 1990 c. O. 40, states that:

“No person shall orally, in writing or electronically, give or submit false or misleading information in any statement, document or data, to any provincial officer, the Minister, the Ministry or the Agency, any employee in or agent of the Ministry or the Agency, or any person involved in carrying out a program of the Ministry or the Agency in respect of any matter related to this Act or the regulations.”

Further, subsection 98(3) of the Act states that:

“No person shall include false or misleading information in any document or data required to be created, stored or submitted under this Act.”

Measurements

All measurements must be recorded in the specified unit, metric or imperial by checking off the applicable box on the top of the form. You must use the checked unit consistently throughout the well record. Measurements must be reported to 1/10th of a metre if the unit is a metre. All measurements of depth must be referenced to ground surface.

Well Owner's Information

A “well owner” means the owner of land upon which a well is situated and includes a tenant or lessee of the land and a well purchaser. If the “well owner” is an individual, record the owner's last name and first name or if the “well owner” is a business, government or other organization, record the name in the “organization” area.

Well Location

Street Number/Name and City/town/Village must be provided, if available.

Geographic Township, Concession and Lot must be reported if the well is located in an area where such information exists.

UTM Coordinates must be recorded each time a Well Record is completed. Click the button [Test UTM in Map] to use the UTM Coordinates to plot the location to Google map. This allows verification of the UTM Coordinates. This will also automatically populate the County/District.

Municipal Plan and Sublet Number may be provided, if available.

Overburden and Bedrock Materials

For each formation encountered during construction, choose words from the lists that best describe the formation on the basis of general colour, most common material, other materials, and general description of the formation.

General Colours are White, Yellow, Grey, Brown, Blue, Red, Green and Black.

Examples of Materials are: Fill, Silt, Top Soil, Coarse Sand, Slate, Muck, Gravel, Limestone, Dolomite, Quartzite, Peat, Stones, Fine Sand, Shale, Granite, Clay, Boulders, Medium Sand, Sandstone, and Greenstone.

Some definitions are as follows:

- Clay: Composed of very fine particles. Forms dense hard lumps or clods when dry and a very elastic putty-like mass when wet. It can be rolled between fingers to form a long, flexible ribbon.
- Silt: Grain size, midway between sand and clay. It may form clods which, when broken, feel soft and floury. When moist, it will form a cast that can be handled freely without breaking. Rolled between thumb and finger, it will not "ribbon" but will give a broken appearance.

- Sand: Grains are loose and granular and may be seen and felt readily. Squeezed in the hand when dry, it falls apart when the pressure is released. Squeezed when moist, it will form a cast that will crumble when touched. Should be listed as fine sand, medium sand or coarse sand.
- Gravel: Rock fragments greater than 0.3 cm in diameter.

Examples of General Descriptions are Loose, Cemented, Previously Dug or Bored, Porous, Layered, Previously Drilled, Dense, Soft, Wood Fragments, Packed, Hard.

Abandonment

To report abandonment of a well, check off the applicable box in Type on the top of the form. Details of abandonment must be recorded in the Abandonment and Sealing Section. Additional comments may be entered in the comments box under the Information section.

Annular Space

Record all material placed in the annular space around the single casing or around the permanent outer casing. If the well is a telescoped well [i.e., a well with an outer casing and inner casing(s)] or if the well is a multi-level nested test hole, report the depth from, depth to, material and volume placed for the annular space between two different sized casings or between the inner casing(s) and the side of the well in the “Comments” area of this electronic well record form.

Method of Construction

If the equipment used to construct the well is not on the list, check “Other (specify)” and record the type of equipment, check each equipment that applies.

Well Use

If the well’s use is not provided on the list, check “Other (specify)” and record the use of the well. If the well has multiple uses, check each use that applies.

Status of Well

If the well’s status is not provided on the list, check “Other (specify)” and record the use of the well. If the well has multiple statuses, check each use that applies.

Construction Record – Casing and Open Hole

Use negative values to report the top of casing above ground surface. For example, if the top of the casing is 0.4 metres above the ground surface and the bottom of the casing 6.0 metres below the ground surface, record the casing “Depth From” as -0.4.

If the top of casing is located below the ground surface (e.g., if a test hole is constructed and the top of casing is located below the ground surface in a flush mounted well vault), report the top of the casing from below ground surface. For example, if the top of the casing is 0.1 metres below the ground surface and the bottom of the casing is 6 metres below the ground surface, record the casing “Depth From” as 0.1.

Note: If a drive shoe is used, the shoe is considered casing and it must be reported if the shoe has a different inside diameter thickness.

If a portion of the well was created an open hole, record the location of the open hole on a separate row, including the diameter and the depth (top and bottom of open hole) from the ground surface.

Construction Record – Well Screen

A “well screen” means perforated pipe or tubing, unsealed concrete tiles or other material installed in a well to filter out particulate matter and form the water intake zone. Therefore, the length of a well screen includes any slotted or perforated area and unsealed area of pipe or tiles.

Water Details

- if groundwater was located, record the depth from the ground surface to the location of the groundwater resource, and
- record if the groundwater quality is “Untested,” “Fresh” (i.e., not salty), or “Other (specify).” If “Other (specify)” is recorded, use the “Other (specify)” dropdown list to select the type of groundwater (e.g., salty, blackish water, yellowish water, mineralized, etc.).

Check off “Gas” if natural gas was encountered during well construction.

Note: Natural gas encounters need to be immediately reported to the ministry at 1-800-268-6060, well purchaser and the owner of the land.

Results of Well Yield Testing

Check off “Pumping Discontinued” if pumping was discontinued before 1 hour of continuous pumping. Explain the reason why pumping was discontinued or in some cases not performed (e.g., the well went dry, impossible to install pump in small diameter well, static water level from test hole or dewatering well was obtained and is reported instead of completing a yield test etc.).

Note: Equipment breakdown is not an acceptable reason for checking off “Pumping Discontinued” on the well record form. If groundwater in the well is flowing out of the well, provide the rate of flow, and check off “Flowing Well” (i.e., static water level above the ground surface).

In the “Results of Well Yield Testing” section of the well record form, record:

- the depth to the intake of the pump,
- the rate of pumping and duration of pumping period during the yield test,
- the final water level when pumping stops,
- water level measurements made during pumping (drawdown) and recovery. All water level measurements must be referenced from below the ground surface for each time interval specified in the drawdown and recovery boxes.

If the water level measurements remain the same over a period of time, continue to measure and report the same water level measurement for the remaining pumping or recovery time intervals.

If pumping continuously for at least 1 hour, but the design of the well does not allow for water level measurements (e.g., driven point well), the person constructing the well is not required to report drawdown or recovery water level measurements.

Map of Well Location

In the “Map of Well Location” section of the well record form, click the map area to attach a map of the well location. The map must show sufficient information to locate the well, including:

- a mark on the map showing the well,
- a scale on the map, and
- where available, the name of the structure, street or surface water body nearest to the well.

Note: More than one map can be added to the well record form by clicking on “Add Map (+)” to add an additional map.

Information

Record any additional information (e.g., observations, tests, additional licensed well technicians who worked on the well, additional annular space details for a telescoped well or a multi-level nested test hole, reasons for not providing a well owner information package) in the comments area.

Declaration

Check the declaration statement to confirm that the person constructing the well agrees with the following statement: “I hereby confirm that I am the person who constructed the well and I hereby confirm that the information on the form is correct and accurate”.

Validate

Click the validate button. If there is no missing information, you will be asked to enter the well tag again to make sure the well tag is entered correctly (only enter the numeric portion of the tag number). The audit number will then be changed from “**incomplete**” to an assigned audit number. The signature field will then be available. Click on “signature” to enter the well technician’s electronic signature. For instructions on how to create an electronic signature, please visit the Adobe Digital IDs website using the following link: <https://helpx.adobe.com/acrobat/using/digital-ids.html>

Notice of Collection of Personal Information

Personal information contained on this form is collected pursuant to sections 35-50 and 75(2) of the *Ontario Water Resources Act* and section 16.3 of the Wells Regulation. This information will be used for the purpose of maintaining a public record of wells in Ontario. This form and the information contained on the form will be stored in the Ministry's well record database and made publicly available. Questions about this collection should be directed to the Water Well Customer Service Representative at the Wells Help Desk, 125 Resources Road, Toronto Ontario M9P 3V6, at 1-888-396-9355 or wellshelpdesk@ontario.ca.

Attention: Mr. Zachary Fisher

Dear Zachary:

**Re: Water Level Readings
 302 and 306 Edinburgh Road South
 Guelph, Ontario**

As requested, CMT Engineering Inc. (CMT Inc.) has obtained water level readings from the monitoring wells (installed by CMT Inc. and MTE) located at 302 and 306 Edinburgh Road South in Guelph, Ontario.

Monitoring wells were installed at Borehole 2, Borehole 103-21, Borehole 105-21 and Borehole 106-21 at the above referenced site.

The following table details the approximate measured water levels and elevations, as well as the dates the water levels were obtained:

Borehole No.	Ground Surface Elevation (m)	Measured Elevation of Water in Monitoring Well on October 28, 2021 (m)	Measured Elevation of Water in Monitoring Well on September 17, 2024 (m)	Measured Elevation of Water in Monitoring Well on October 28, 2024 (m)	Measured Elevation of Water in Monitoring Well on December 17, 2024 (m)
BH2	324.23	N/A	N/A	320.13 (4.10)	319.83 (4.40)
MW103-21	324.00	318.70 (5.30)	319.74 (4.26)	319.63 (4.37)	319.58 (4.42)

Monthly water balance strategy as outlined in the document *Instructions and Tables for Computing Potential Evapotranspiration and the Water Balance (Thornthwaite and Mather, 1957)*

Parcel 1 to 8 - Design of Infiltration Structure #1 to 8

Length = 60.00 m
 Width = 2.13 m
 Depth = 0.60 m

Contact Area 127.80 sq m

Volume of Clear Stone = 76.68 cu m
 Clear Stone Void Ratio = 0.33333

Storage = 25.56

Total Storage Volume of Structure = 25.56 cu m

A = contact area of structure = 127.80 sq m
 V = runoff volume to be infiltrated = 25.56 cu m
 P = percolation rate of native soils = 29.20 mm/h
 n = porosity of storage media (weighted) = 0.33
 T = retention time = Solve for T
 Contact Area taken as the bottom of the structure.

$T = (1000 \times V) / (P \times n \times A) = 20.76 \text{ hours or } 0.9 \text{ day draindown period}$

Contributing Area 0.25 ha
 Recharge Time 20.76 hours / 0.86 days
 Recharge Volume Potential 25.56 m³

Month	Total Recharge & Runoff (mm)	No. of days	Max Potential Recharge (m ³)	Available Recharge (m ³)	Enhanced Recharge (m ³)
